

Learning Gender Classes in Italian via a Computerized Word Learning Game: A study with 7 year olds

Dr Elizabeth Wonnacott, Dr Helen Brown & Miss Lydia Gunning

Department of Language and Cognition,

Division of Psychology and Language Sciences

30 March 2017

Background: Grammatical Gender

- Many languages divide words into “gender”(masculine, feminine, neuter)
- Gender classes are notoriously difficult for second language learners where the first language doesn't contain gender classes
- In contrast: seems to present relatively little difficulty in first language acquisition
 - 3 year olds use gender predictively pattern (e.g. Lew-Williams & Fernald 2007)

*la
pelota*

***Faster to look at
the target word
when different
gender from the
foil***

*el
zapato*

*la
galleta*

“Encuentra la pelota. ¿La ves?”

Find the ball. Do you see it?

Background: Grammatical Gender

- Many languages divide words into “gender” (masculine, feminine, neuter)
- Gender classes are notoriously difficult for second language learners where the first language doesn’t contain gender classes
- In contrast: seems to present relatively little difficulty in first language acquisition
 - 3 year olds use gender predictively pattern (e.g. Lew-Williams & Fernald 2007)
- Second language: even highly proficient adults may not show this pattern (e.g. Gruter, Lew-Williams & Fernald, 2012)

Statistical Learning Literature

- Focused on the problem of how the language learning system extracts gender classes from the input without explicit teaching.

Various experiments with computational and human (adult) learners

Statistical Learning Literature

- Mintz (2002): Learners hear sentences from an artificial language:

*“bol **nex** jiv” and “choon **pux** wug”*

environments

bol__jiv
zim__noof
poz__fen

CLASS ONE

nex
kwob
zich
pren

environment

choon__wug

CLASS TWO

pux
daik
fend
plif

- Test: Judge grammaticality of **novel** combinations

poz **zich** fen

correct class

poz **plif** fen

incorrect class

Statistical Learning Literature

- Gomez (2002): Infants exposed to three word strings like

“*pel wadim rud*” and “*dak kickey tood*”

pel__rud
dak__tood
vot__jic

“frames”

Manipulate number
of possible words in
the middle slot
3, 12 or 24

wadim
kickey
fengle
coomo..

Infants only discriminate when hear the
frames with 24 middle words
→ *benefit from more varied examples*

- Test: Judge **novelty** of sentences

pel wadim rud

pel wadim jic

Our Experiment

- **Native English speaking 7** years olds learning **number** and **gender marking** in Italian noun-phrases (no previous experience of Italian)
- Can children pick up on gender marking from a **computerized word learning game** (no explicit teaching of gender)
- Do they benefit from “variability” i.e. is it helpful to exemplify the gender classes more example nouns
- Also want to look for any evidence of automatized processing (as seen in native speakers)

Italian definite noun-phrases

masculine singular:	il	noun _[masculine]	+ o	il letto
masculine plural:	i	noun _[masculine]	+i	i letti
feminine singular:	la	noun _[feminine]	+a	la ballena
feminine plural:	le	noun _[feminine]	+e	le ballene

 “frame”

Variability Manipulation

12-nouns (HV): 6 masculine 6 feminine

4-nouns (LV): 2 masculine 2 feminine

Methods

Participants

- Thirty 7-8 year olds
(M=7yrs, 10 months)
 - 15 in 12-nouns (HV)
 - 15 in 4-nouns (LV)

Day 1

- exposure
(84)

Day 2

- exposure
(168)

Day 3

- exposure
(84)
- tests

Day 4

- exposure
(168)

Day 5

- exposure
(84)
- tests

12-nouns: 12 nouns * 7
4-nouns : 4 nouns * 21

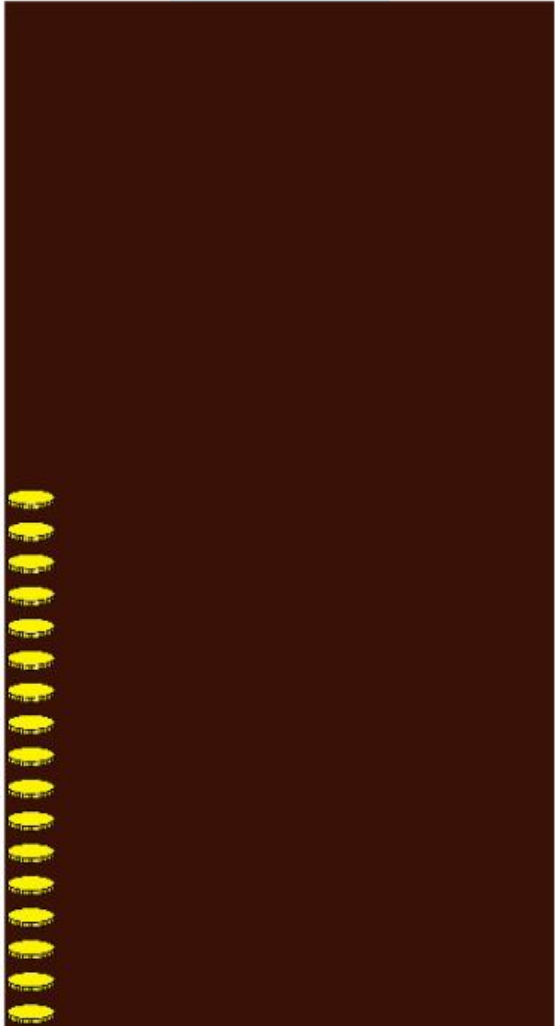

TODAY

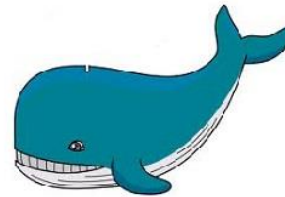

2 AFC test
Speeded noun ID task
Production test

Training Data

Better learning in low variability condition

➤ Less words to learn

% Correct

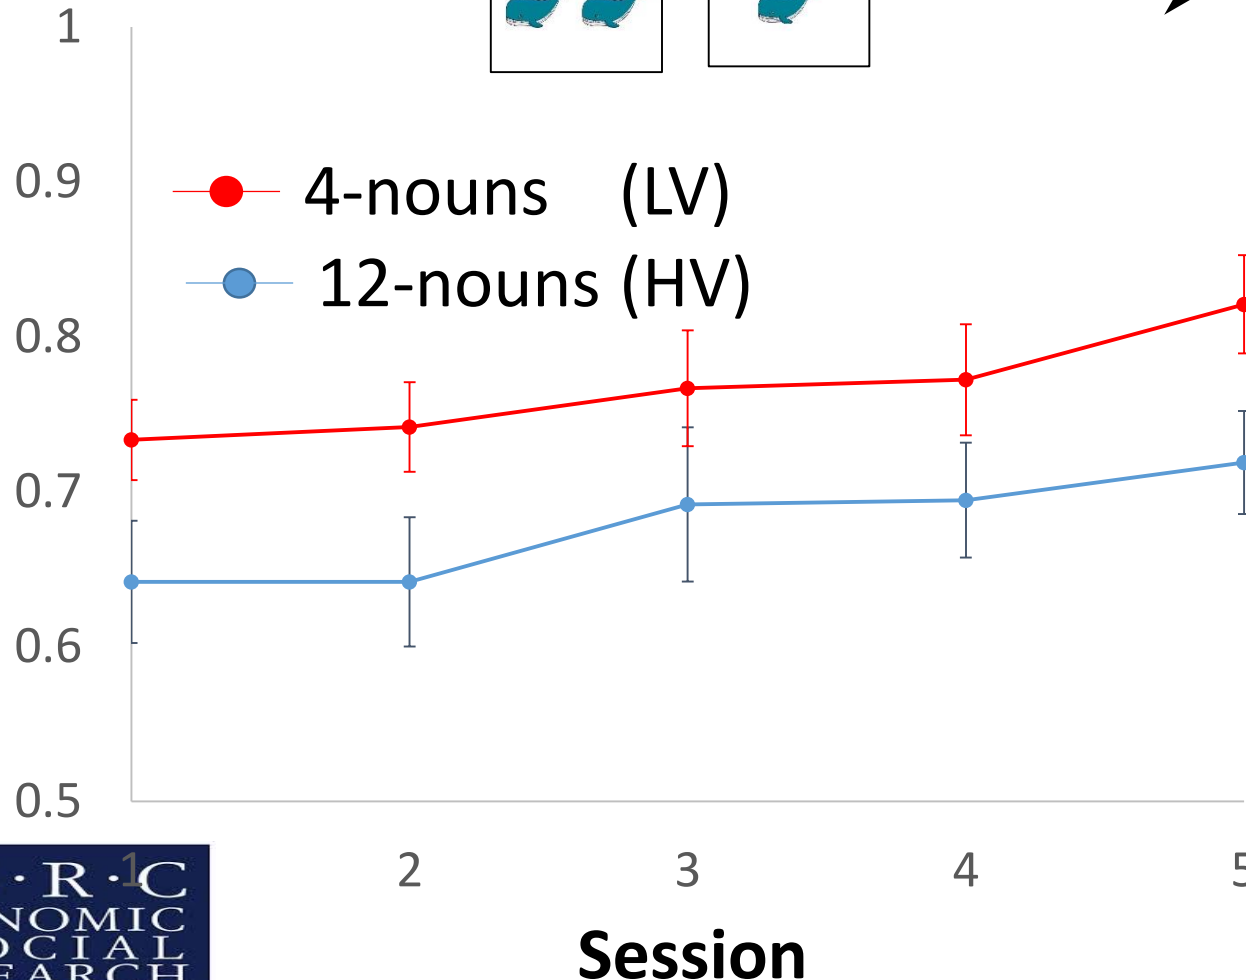

Training

Training Data (2)

% Correct

Better learning in the 4-nouns condition

- Easier to learn the singular/plural forms in the context of two nouns than in the context of six nouns

BENEFIT FROM LESS VARIED EXAMPLES

*Easier to see the link between the number **marking** and number **semantics** when repeatedly hear with the same lexical items*

Speeded Noun Identification

target & foil DIFFERENT gender

target & foil SAME gender

Speeded version of training task

- **QUESTION:** Do they use gender marking in identifying the noun?

PREDICTION:

Should be **faster** in the **different gender trials**
since can identify target before onset of noun
(Lew Williams & Fernald, 2007)

Speeded Noun Identification

*No effect of variability
(collapsed)*

TRUE ON DAY 5
BUT NOT DAY 3

- takes more input to see these effects in processing

2AFC Test of Frames

correct noun-phrase

masculine singular:	il	noun _[masculine] + o	il letto
masculine plural:	i	noun _[masculine] + i	i letti
feminine singular:	la	noun _[feminine] + a	la balena
feminine plural:	le	noun _[feminine] + e	le balene

foil

(**determiner** and **vowel** don't match)

Familiar nouns
& unfamiliar nouns

la balena

il balena

2AFC Test of Frames

	FAMILIAR
HIGH VARIABILITY	90%
LOW VARIABILITY	93%

2AFC Test of Frames

	FAMILIAR	UNFAMILIAR
HIGH VARIABILITY	90%	48% <i>CHANCE</i>
LOW VARIABILITY	93%	55%

No effect of
variability
condition

- Strong item learning but no generalization of frames independent of the nouns

Summary

- Strong item level learning
 - High accuracy with familiar items in the 2AFC test
 - Evidence that gender marking is used in identifying the familiar nouns
 - Representations become more robust with increased exposure
- Generalization weak/tentative
 - Unfamiliar nouns test 2AFC at chance
 - Aren't learning "frames" independent of the nouns
 - Number marking is better learned in the **LOW** variability condition
 - For this game, high variability doesn't lead to generalization (and too much variation may actually hinder learning plurals)

Future Directions

- Age comparisons – compare with 11 year olds.
- How to encourage generalization?
 - Learn singulars first (two training sessions) → move to plurals
 - “Skew” the input – most nouns of one gender, a few “exceptions” the other gender
 - Augment with explicit instruction

Future Directions

- Research using the same “game” exploring aspects of language learning:
 - **Vocabulary learning** – is it better when learning from multiple speakers than one speaker?
 - **Phonetic learning** – do children learn phonetic contrasts better when hear from multiple talkers.
 - **Chinese Tone learning** – can children pick up on lexical use of tone without instruction?

Implications

- Computerized training can provide children with a lot of input – complement classroom teaching
- What type of input is best?
